1.0 INTRODUCTION

On behalf of Consolidated Edison Company of New York, Inc. (Con Edison), Shaw Environmental, Inc. (Shaw) has prepared this *Pre-Interim Remedial Measure (IRM) Investigation Summary Report* to present the results of subsurface assessment activities conducted by Shaw at the former Con Edison Kent Avenue Generating Station (the "Site") on May 7-11 and June 1, 2012.

The Site is located at 500 Kent Avenue, Brooklyn, Kings County, New York. The Site is bounded by Division Avenue to the north, the former Brooklyn Navy Yard to the south (formerly Nassau Gas Works, a manufactured gas plant site), Kent Avenue to the east, and Wallabout Channel (tidal tributary to the East River) to the west. A Site Location Map is provided as **Figure 1**. The total area of the Site is approximately 4 acres. It was formerly occupied by vacant 7- and 9-story structures with a footprint of approximately 2.6 acres, which formerly housed an electrical generating station. The above-ground structures were removed/demolished in 2009. The remaining 1.4 acres of the Site consist of a vacant area on the southern portion of the property (where a previously demolished portion of the generating station complex was located), a concrete walkway in the western portion, and a small concrete/unpaved side yard in the northern portion.

The Site has been the subject of previous site investigations and remedial actions related to the former generating plant operated there. In late 2011/early 2012, the Ash Pit at the northwestern portion of the Site was remediated by the removal and dewatering of sludge from the pit, disposal of dewatered sludge at off-site disposal facilities, treatment and permitted discharge of filtrate into Wallabout Channel, closure of the pit with lightweight concrete, and placement of a reinforced concrete cap over the pit.

The purpose of this investigation was to identify any Site-related petroleum/chemical impacts and discover potential light non-aqueous phase liquid (LNAPL) impacts at or below the water-table, to a minimum depth of 30 feet (ft) below ground surface (bgs), in the area between the former building foundation slab and Wallabout Channel, as shown on **Figure 2**, Pre-IRM Soil Boring Locations. The work scope and technical approach for the Site investigation are presented in Shaw's Pre-IRM Investigation Work Plan dated April 2012.

Subsurface structures remain at the Site that had an impact on the investigative tasks described in this report. In particular, the area of interest between the former building

footprint and Wallabout Channel currently contains a network of intake and discharge tunnels formerly used to bring coolant water into the power plant; a bulkhead infrastructure along Wallabout Channel on the Site's western boundary; remnants of the former building basement slab and wall footings; and an extensive timber piling system that supports these structures. The intake/discharge tunnels and corresponding tunnel headwalls (see **Figure 2**) are constructed of cast-in-place concrete, and according to cross-section drawings are (in certain locations) up to 31 ft in thickness. The bulkhead infrastructure consists of steel sheet piling with steel tiebacks in the northern portion of the Site, and a system of timber pile platforms, timber cutoff walls, and cast-in-place concrete seawall in the southern portion (**Figure 2**). The remnant basement slab (concrete) of the former building(s), ranging 2-8 ft in thickness, rests at approximately 7 ft bgs and is supported by timber piles. According to an inspection and condition survey prepared by McLaren Engineering in 2006, voids exist below the ground surface in the areas of the former intake tunnel screen wells, and in some areas where there has been a loss of fill. The soil borings described in this report were placed to avoid these subsurface structures, as well as to accommodate areas of the Site identified with restricted and limited loading safety recommendations (**Figure 2**). Actual soil boring placement in the field, therefore, may differ slightly from the boring locations proposed in the Pre-IRM Investigation Work Plan.

1.1 Site Topography and Geology

The Site is located in Kings County on the northwestern shore of Long Island. The Site is generally flat and lies at an elevation of approximately 10 ft above mean sea level. The geology of Long Island consists of varying thicknesses of Pleistocene-age glacial till, outwash sediments (consisting of fine to coarse grained sand with interstitial lenses of gravel and silt), and marine deposits, overlying a sloping bedrock surface. Bedrock elevation in the Site vicinity is approximately -100 ft NGVD (National Geodetic Vertical Datum of 1929).[1] During 2004-2005 drilling activities conducted by others associated with the former Nassau Gas Works manufactured gas plant at locations west and southwest of the southern boundary of the Site, bedrock was encountered between 103 and 108 ft (-94.04 and -97.34 ft NAVD (North American Vertical Datum of 1988)).[2]

Site-specific stratigraphy was gathered during soil boring advancement activities. Based on soil collected via continuous sonic core barrel sampling, the Site is underlain by fill, fine to coarse grained sand and silty sand with some stones to a depth of at least 50 ft below ground surface (bgs). Additional information on subsurface stratigraphy is provided in **Section 3.2** below.

According to maps found in technical literature,[3] the Site location appears to be one that was landfilled sometime between 1844 and 1900. Landfills in New York City during this time period were typically composed of sediments consisting of coal ash, cinders, slag, brick, wood, and cement. This is consistent with the findings by previous Site investigations of ash, concrete, and brick, as well as sand, silt, gravel, and clay in the upper 15 ft of the soil column. The water table is at an elevation approximately level with the surface water altitude in the adjacent Wallabout Channel, and thus is likely to be influenced by tidal variations. Depth to groundwater at the Site is approximately 8 ft bgs.

2.0 SITE INVESTIGATION HISTORY

Site Investigation history has been summarized within the following documents:

- *Phase I Environmental Site Assessment Report*, H2M, September, 1999;

3.0 FIELD ACTIVITIES

The field program was conducted at the Con Edison Former Kent Avenue Generating Station between May 7 and 11, 2012 (with supplemental Site restoration work performed on June 1, 2012) in accordance with the Pre-IRM Investigation Work Plan dated April 2012, and approved by Con Edison on April 17, 2012. The goal of the pre-IRM investigation field activities was to identify any petroleum/chemical impacts and discover potential LNAPL impacts at or below the water-table to a minimum depth of 30 ft bgs, in the area between the former building foundation slab and Wallabout Channel.

A summary of the work performed, including any deviations from the scope of work outlined in the work plan, is discussed in the following sections.

3.1 Underground Utility Clearance

A utility clearance was made prior to the start of intrusive work. The clearance was performed in accordance with the Utility Clearance Process for Intrusive Activities: EH&S Remediation Program, Revision 1, Con Edison, October 8, 2003. In order to identify utilities located within approximately 50 ft of Wallabout Channel along the Site's western boundary, Shaw reviewed Site drawings, "As-Built" drawings, and electrical utility plates provided by Con Edison; water and sewer maps provided by the New York City Department of Environmental Protection (NYCDEP); and survey results maps from previous geophysical surveys performed at the Site in 2006 and 2009.

A geophysical survey to locate underground utilities was performed on May 7, 2012 by NAEVA Geophysics, Inc. (NAEVA), a subcontractor to Shaw. The survey was performed using ground-penetrating radar, electromagnetic devices, and radio frequency (RF) transmission/reception. All utilities identified by the surveys were marked on the overlying ground surface with spray paint and marking flags. NAEVA developed figures showing the results of the "refreshed" geophysical survey. These figures are presented in **Attachment 1**. On May 7, 2012, a Site walk was performed to review the results of the geophysical survey, and to identify visual evidence of the presence of underground and aboveground utilities.

Also on May 7, 2012, McLaren Engineering Group (McLaren), a subcontractor to Shaw, performed a diving inspection in the area of soil boring locations **DB-1** and **DB-2**. Soil borings DB-1 and DB-2 were placed in the northwestern portion of the Site (near the

former ash pit) in close proximity to a steel sheet pile bulkhead along Wallabout Channel that is secured with tiebacks that extend into the interior of the Site. Divers were used to locate the bulkhead tie rods so the borings could be placed to avoid these features. The divers also assisted in assessing the undermined fill (void) beneath the slab in this area.

A New York City "One-Call" utility markout request was called in by the driller for the project, Aquifer Drilling and Testing, Inc. (ADT), a subcontractor to Shaw, prior to the start of Site drilling activities. At a minimum, the upper 5 ft of each boring was cleared by vacuum-powered apparatus prior to the use of drilling equipment to continue the boring. If solid concrete was present for the first 5 ft below the surface, and it was decided that the boring would not be relocated (as occurred at two soil boring locations, DB-5 and DB-6), the concrete was penetrated by slow advancement of the drill string until a 5-foot depth was reached.

3.2 Soil Borings

From May 8-11, 2012, ADT, on behalf of Con Edison and under the direction of Shaw, advanced five (5) soil borings using a Sonic Drill SDC390 sonic drill rig unit with continuous core-barrel sampling capability. The following "deep boring" (or DB) soil borings were advanced along the western boundary of the Site, as illustrated in **Figure 2**, to identify any petroleum/chemical impacts and discover potential LNAPL at or below the water-table:

- **DB-1** – Area between former building slab/footprint and Wallabout Channel, at northwestern portion of Site (near ash pit);
- **DB-2** – Area between former building slab/footprint and Wallabout Channel, at northwestern portion of Site (near north discharge tunnel);
- **DB-3** – Area between former building slab/footprint and Wallabout Channel, at west-central portion of Site (east of north discharge tunnel);
- **DB-5** – Area between former building slab/footprint and Wallabout Channel, at southwestern portion of Site (near south discharge tunnel); and
- **DB-6** – Area between former building slab/footprint and Wallabout Channel, at southwestern portion of Site (east of south discharge tunnel).

Soil boring **DB-4** was proposed for the area between the former building slab/footprint and Wallabout Channel at the west-central portion of the Site (west of the north discharge tunnel, see Figure 2); however, after coring through an 11-inch concrete slab at this

location, another layer of concrete was discovered below this. In telephone consultation with Douglas MacNeal (NYSDEC Project Manager) on May 11, 2012, and with the successful advancement of soil boring DB-3 (to 35 ft bgs) located approximately 45 ft to the east of proposed DB-4 which showed no field evidence of contamination, NYSDEC did not require the completion of DB-4.

At the **DB-1** and **DB-2** boring locations, due to undermining behind the seawall, a void existed below the ground-level slab to approximately 12-14 ft bgs. After coring through the concrete slab, the sonic drill string was lowered to the ground below (to the approximate level of the shoreline of Wallabout Channel) to begin the boring. At **DB-3**, the upper 3-4 ft of cleared material consisted of newly placed crushed rock. At boring locations **DB-5** and **DB-6**, after clearing approximately 12-18 inches of topsoil, a concrete slab and small-gauge steel rails were encountered. To avoid drilling into the former south discharge tunnel, these borings were relocated to the east (**Figure 2**).

Hand-clearing of soil boring locations using a Vactron and "air knife" began on May 8, 2012. The boring locations were cleared over a two-day period. A concrete coring machine was used to open a boring location placed on concrete. Soil cuttings from the vacuum-clearing process were examined for texture, color, and visual or olfactory evidence of contamination by a Shaw geologist. In addition, the soil cuttings were screened for the presence of volatile organic compounds (VOCs) using a photoionization detector (PID). Soil vacuuming continued to a depth of 5 ft bgs (or until concrete was encountered). No soils from the vacuum clearing process exhibited visual, olfactory, or PID evidence of contamination.

On May 10 and 11, 2012, boreholes were advanced with the Sonic Drill SDC390 unit under the supervision of a Shaw geologist. At each boring location soil samples were collected using a sonic-driven 3⅝-inch core barrel with a dedicated, internal liner. A 6-inch outer casing was advanced as necessary. Soil samples were collected continuously from 5 ft bgs until the desired depth (minimum of 30 ft bgs) was encountered.

Soils in each 10-foot core barrel were evaluated in the field for visual or olfactory evidence of contamination, screened with a PID, and described in a written log for the following: percent of recovered sample in the core barrel/internal liner, soil color, soil texture, and general soil classification under the Unified Soil Classification System. PID readings during soil boring advancement ranged from 0.0 to 465 parts per million (ppm)

with the maximum reading (465 ppm) recorded at DB-5 between 21 and 21.5 ft bgs. Soil boring logs generated during the advancement activities are provided in **Attachment 2**.

Soil samples were collected from each boring from the internal liner and inserted directly into laboratory-supplied glassware. Two to three soil samples were selected from each boring for laboratory analysis. In general, a soil sample was collected from the (vadose) zone of dry soil, if present; from the top of the saturated zone (shallowest wet sample); and from a minimum of 30 ft bgs. Selection of samples was biased toward those samples exhibiting evidence of contamination, and was based on the professional judgment of the geologist. Select photographs from the drilling program are presented in **Attachment 3**.

The soil samples were submitted for laboratory analysis of:

- NYSDEC Commissioner Policy 51 (CP-51) listed VOCs by EPA Method 8260B;
- NYSDEC CP-51 listed SVOCs by EPA Method 8270C; and
- Target Analyte List (RCRA/CP-51) Metals by EPA Methods 6010B/7471A/9012A.

Samples were picked up on May 15, 2012 by the laboratory, TestAmerica, located in Edison, New Jersey. Samples were analyzed with a 5-day turnaround time. Field operating procedures and practices conformed to the Quality Assurance Project Plan, as contained in Shaw's Pre-IRM Investigation Work Plan dated April 2012.

3.3 Waste Containment and Disposal

Investigation derived waste (IDW) streams generated during the pre-IRM investigation included:

- Drill cutting soils from sonic casing/core barrel advancement, and vacuumed soils from the boring pre-clearing process; and
- Water used as a drilling aid during sonic core barrel/casing advancement.

These wastes were containerized together in 55-gallon USDOT-approved steel drums. At the end of each work day, all open drums were sealed and were moved to the temporary onsite waste storage location at the southeastern portion of the Site (adjacent to the fence and north of the gate along Kent Avenue).

Shaw collected a composite sample from the drums on May 11, 2012 and submitted the sample to TestAmerica. The sample was analyzed for the following hazardous characteristics: RCRA 8 metals, toxicity characteristic leaching procedure (TCLP) VOCs and SVOCs, polychlorinated biphenyls (PCBs), ignitability, pH, sulfide reactivity, and cyanide reactivity. The sample laboratory results, presented in **Attachment 4**, indicated that the drummed material is non-hazardous.

Con Edison was provided the IDW sample laboratory results and the drums were labeled as non-hazardous. On May 25, 2012, Con Edison's Construction Management had the drums removed from the Site and transported for proper disposal.

4.0 ANALYTICAL REVIEW

Soil laboratory analytical data received for the soil samples collected during boring activities were compared to the NYSDEC CP-51/Part 375-6.8(b) Restricted Residential Soil Cleanup Objectives (RRSCOs) to assess potential future use scenarios for the Site.

4.1 Regulatory Criteria

NYSDEC issued its Final CP-51/Soil Cleanup Guidance document on October 21, 2010. The Guidance document states that NYSDEC's policy is that all environmental remedies be protective of human health and the environment. It also states that it is NYSDEC's preference that environmental remedies be designed such that the implementation of the final remedy results in no future land use restrictions. The Guidance document indicates that NYSDEC recognizes that it is not always feasible to return a site to a condition where no restrictions are required, and some of the NYSDEC remedial programs are predicated on future site use.

The analytical results from most previous investigations at the Site were compared to the NYSDEC Technical and Administrative Guidance Memorandum (TAGM) #4046 Recommended Soil Cleanup Objectives (RSCOs). The referenced NYSDEC CP-51 Guidance document replaces the TAGM #4046 RSCOs. The Soil Cleanup Objectives (SCOs) found in 6 NYCRR Subpart 375-6, Remedial Program Soil Cleanup Objectives, have been incorporated into the CP-51 Guidance document and are the appropriate guidance levels for use in evaluating the soil sample analytical results of the pre-IRM investigation. Given the historical "making" of land along the New York City waterfront

with a wide variety of fill materials, it is not feasible to remediate the Former Kent Avenue Generating Station property without some future land use restrictions. Since the property lies on the waterfront, the Restricted Residential SCOs were chosen as the potential highest future land use scenario for the Site.

4.2 Soil Analytical Data

A total of thirteen (13) soil samples and one (1) trip blank were submitted for laboratory analysis as follows:

Soil Boring	**No. of Samples Collected** (depth)	**Sample Analyses**

The analytical results for VOCs are summarized in **Table 1**. The analytical results for SVOCs are summarized in **Table 2**. The analytical results for Metals are summarized in **Table 3**. Results in **bold** and red highlight exceed applicable NYSDEC CP-51/Part 375-6.8(b) RRSCOs. The laboratory analytical data package, prepared under the

requirements for the NYSDEC Analytical Services Protocol (ASP) Category B deliverable, is included as **Attachment 5**.

4.3 Volatile Organic Compound Findings

A review of the soil sample analytical results on **Table 1** did not identify VOC concentrations in excess of the applicable CP-51/Part 375-6.8(b) RRSCOs in any of the soil samples. Elevated concentrations of Styrene, Isopropylbenzene, Benzene, Toluene, o-Xylene, Ethylbenzene, Methylcyclohexane, m&p-Xylene, 1,2,4-Trimethylbenzene, n-Propylbenzene, 1,3,5-Trimethylbenzene, and p-Isopropyltoluene were detected in DB-6 (30-30.5') but were below RRSCOs.

Of note, as indicated on the soil boring log for DB-5, the elevated PID reading (465 ppm) at the DB-5 (21-21.5') depth interval is likely due to the single compound Methylcyclohexane reported at 3,600 ppb (see **Table 1**).

4.4 Semivolatile Organic Compound Findings

A review of the soil sample analytical results on **Table 2** identified two and four SVOC concentrations in excess of applicable CP-51/Part 375-6.8(b) RRSCOs in two of the soil samples, DB-1 (34.5-35') and DB-6 (29.5-30'), respectively.

Elevated concentrations of additional SVOCs were also identified in the above noted soil samples DB-1 (34.5-35') and DB-6 (29.5-30'), as well as in soil samples DB-2 (13.5-14') and DB-6 (15-15.5'), however these concentrations were below RRSCOs.

4.4.1 SVOC Restricted Residential SCO Exceedances

As highlighted in **Table 2** and as shown on **Figure 3**, Benzo[a]anthracene and Indeno[1,2,3-cd]pyrene concentrations in excess of applicable RRSCOs were identified in soil sample DB-1 (34.5-35'). Benzo[a]anthracene, Benzo[a]pyrene, Benzo[b]fluoranthene, and Indeno[1,2,3-cd]pyrene concentrations in excess of applicable RRSCOs were identified in soil sample DB-6 (29.5-30').

When the analytical results are compared to the NYSDEC CP-51/Part 375-6.8(b) Commercial Soil Cleanup Objectives (CSCOs), only one of the above SVOC compounds, Benzo[a]pyrene, is in excess of applicable CSCOs. When the results are

compared to the NYSDEC CP-51/Part 375-6.8(b) Industrial Soil Cleanup Objectives (ISCOs), none of the SVOCs concentrations is in excess of applicable ISCOs.

4.5 Metals Findings

A review of the soil sample analytical results on **Table 3** identified one Metals concentration in excess of applicable CP-51/Part 375-6.8(b) RRSCOs in one of the soil samples, DB-1 (34.5-35').

Elevated concentrations of additional Metals were also identified in the above noted soil sample DB-1 (34.5-35'), as well as in soil sample DB-6 (39.5-40'), however these concentrations were below RRSCOs.

4.5.1 Metals Restricted Residential SCO Exceedance

As highlighted in **Table 3** and as shown on **Figure 3**, an Arsenic concentration in excess of applicable RRSCOs was identified in soil sample DB-1 (34.5-35'). This soil sample showed an Arsenic level of 17.8 milligrams per kilogram (mg/Kg) or ppm; the applicable RRSCO is 16 ppm. The range of Eastern USA Background Arsenic concentrations, provided in the NYSDEC TAGM #4046 RSCOs, is between 3 and 12 ppm.

5.0 ANALYTICAL SUMMARY

As discussed in **Section 4.3** above, none of the VOC concentrations detected in the soil samples were in excess of the applicable CP-51/Part 375-6.8(b) RRSCOs.

5.1 Restricted Residential Soil Cleanup Objectives

As discussed in **Section 4.4** above, two SVOC concentrations (Benzo[a]anthracene and Indeno[1,2,3-cd]pyrene) in excess of applicable RRSCOs were identified in soil sample DB-1 (34.5-35'), and four SVOC concentrations (Benzo[a]anthracene, Benzo[a]pyrene, Benzo[b]fluoranthene, and Indeno[1,2,3-cd]pyrene) in excess of applicable RRSCOs were identified in soil sample DB-6 (29.5-30').

As discussed in **Section 4.5** above, one Metals concentration (Arsenic) in excess of applicable RRSCOs was identified in soil sample DB-1 (34.5-35').

6.0 CONCLUSIONS AND RECOMMENDATIONS

Information gathered during the pre-IRM field activities did not identify LNAPL impacts at or below the water-table at the Site, to soil boring depths ranging from 35 to 50 ft bgs, in the area between the former building foundation slab and Wallabout Channel.

Based on soil analytical results obtained during the pre-IRM investigation, no VOC concentrations in excess of applicable NYSDEC CP-51/Part 375-6.8(b) RRSCOs were identified in any of the soil samples collected during soil boring activities. Two SVOC concentrations and one Metals concentration in excess of applicable RRSCOs were identified in soil sample DB-1 (34.5-35') collected at the northwestern portion of the Site; and four SVOC concentrations in excess of applicable RRSCOs were identified in soil sample DB-6 (29.5-30') collected at the southwestern portion of the Site. The SVOCs identified in excess of RRSCOs are polycyclic aromatic hydrocarbons (PAHs), which occur in oil, coal, and tar deposits, and are produced as byproducts of fuel burning.

As a result of the above described SVOC concentrations in soils identified in excess of applicable RRSCOs at the 30-35 ft depth interval at two locations at the Site, Shaw recommends that a *Site Management Plan* (SMP) be developed per the requirements outlined in NYSDEC DER-10/Technical Guidance for Site Investigation and Remediation (dated May 3, 2010).

The SMP should address 1) the environmental, health, and safety hazards of contamination remaining at the Site; 2) the need and implementation of applicable engineering controls, such as the design and installation of a vapor barrier and sub-slab depressurization system (SSDS) beneath any future structures constructed at the Site, particularly if the building has a basement; and 3) the development of an operation, maintenance, and monitoring plan for any engineering controls employed at the Site to assure continued effectiveness.

Note that the conclusions and recommendations presented above are dependent on and may be revised by the results of the upcoming interim remedial measure (IRM) planned for the Site, as outlined in Shaw's IRM Remedial Action Work Plan (RAWP) dated September 2012.

CASE NARRATIVE

Client: Shaw Environmental & Infrastructure, Inc

Project: Cond Edison 500 Kent Ave, Brooklyn

Report Number: 460-40258-1 Revision 1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) as a result of a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes or interferences which exceed the calibration range of the instrument.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 5/15/2012 4:35 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 1.6º C.

Except:

Recieved samples as Dirt in Jar.

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

TOTAL METALS

Samples 460-40258-1 through 460-40258-11 and 460-40258-13 were analyzed for total metals in accordance with EPA SW-846 Method 6010B. The samples were prepared and analyzed on 05/17/2012.

As a standard practice all soil samples and related QC samples (i.e., MB, LCS, Dup, MS, SD) are diluted 2X-4X prior to analysis. Further dilutions may be required dependent upon analyte levels in the samples. Refer to the analytical results forms for dilutions.

Samples 460-40258-1 through 460-40258-11(4X) and 460-40258-13(4X) required dilution prior to analysis. The reporting limits have been adjusted accordingly.

The matrix duplicate %RPD for calcium associated with batch 112924 was outside the control limits. The matrix spike(MS) recoveries for calcium, antimony in batch 112924 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria.

Refer to the QC report for details.

No other difficulties were encountered during the metals analyses.

All other quality control parameters were within the acceptance limits.

HEXAVALENT CHROMIUM

Samples 460-40258-1 through 460-40258-11 and 460-40258-13 were analyzed for hexavalent chromium in accordance with EPA SW-846 Method 3060A/7196A. The samples were prepared and analyzed on 05/21/2012.

No difficulties were encountered during the hexchrome Cr6 analyses.

All quality control parameters were within the acceptance limits.

TOTAL MERCURY
Samples 460-40258-1 through 460-40258-11 and 460-40258-13 were analyzed for total mercury in accordance with EPA SW-846 Method 7471A. The samples were prepared and analyzed on 05/16/2012.

No difficulties were encountered during the Hg analyses.

All quality control parameters were within the acceptance limits.

VOLATILE ORGANIC COMPOUNDS (GC-MS)
Samples 460-40258-1 through 460-40258-10, 460-40258-12 and 460-40258-13 were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were prepared on 05/16/2012 and analyzed on 05/18/2012.

Methylene Chloride and Toluene were detected in method blank LB3 460-112896/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged “J”. If the associated sample reported a result above the MDL and/or RL, the result has been “B” flagged. Acetone was detected in method blank MB 460-113081/5 at a level exceeding the reporting limit. If the associated sample reported a result above the MDL and/or RL, the result has been “B” flagged. Methylene Chloride was detected in method blank MB 460-113081/5 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged “J”. If the associated sample reported a result above the MDL and/or RL, the result has been “B” flagged. Refer to the QC report for details.

The matrix spike / matrix spike duplicate (MS/MSD) recoveries of several analytes were outside control limits in batch 113082. 1,2,4-Trimethylbenzene was present in the original sample at a high concentration relative to the spike amount. The associated laboratory control sample (LCS) recovery met acceptance criteria.

The matrix spike duplicate (MSD) recoveries for batch 112972 were outside control limits for cis-1,3-Dichloropropene, trans-1,3-Dichloropropene and Bromoform. The associated laboratory control sample (LCS) recoveries met acceptance criteria.

The following sample was diluted due to the abundance of target analytes: DB-5 21-21.5' (460-40258-7). Elevated reporting limits (RLs) are provided.

The following sample was diluted due to the abundance of target and non-target analytes: DB-6 30-30.5' (460-40258-12). Elevated reporting limits (RLs) are provided.

Refer to the QC report for details.

No other difficulties were encountered during the volatiles analyses.

All other quality control parameters were within the acceptance limits.

VOLATILE ORGANIC COMPOUNDS (GC-MS)
Sample 460-40258-14 was analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 05/17/2012.

Bromoform, cis-1,3-Dichloropropene and trans-1,3-Dichloropropene failed the recovery criteria low for the MSD of sample 460-40177-14 in batch 460-112972. The presence of the '4' qualifier in the report indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Refer to the QC report for details.

No other difficulties were encountered during the volatiles analysis.

All other quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)
Samples 460-40258-1 through 460-40258-11 and 460-40258-13 were analyzed for semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 05/17/2012 and 05/18/2012 and analyzed on 05/18/2012, 05/20/2012 and 05/21/2012.

2,4,6-Tribromophenol, 2-Fluorobiphenyl, 2-Fluorophenol, Nitrobenzene-d5, Phenol-d5 and Terphenyl-d14 failed the surrogate recovery criteria low for 460-40276-A-30-A MS. 2,4,6-Tribromophenol, 2-Fluorobiphenyl, 2-Fluorophenol, Nitrobenzene-d5, Phenol-d5 and Terphenyl-d14 failed the surrogate recovery criteria low for 460-40276-A-30-B MSD. Refer to the QC report for details.

The matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 112983 were outside control limits for 2,4-Dinitrophenol and Benzoic acid. The %RPD did not calculate (NC) for Benzoic acid. The associated laboratory control sample (LCS) recovery met acceptance criteria.

The matrix spike/ matrix spike duplicate (MS/MSD) associated with batch 113111 were diluted due to the nature of the sample matrix and abundance of target analytes: AOC18-26(11.5-12) (460-40276-30 MS), AOC18-26(11.5-12) (460-40276-30 MSD). As such, surrogate and spike recoveries were diluted out and are not reported.

Matrix spikes for batch 113111 could not be recovered due to sample matrix interferences which required sample dilution. The associated laboratory control sample (LCS) met acceptance criteria.

Due to the high concentration of 2-Methylnaphthalene and Phenanthrene, the matrix spike / matrix spike duplicate (MS/MSD) for batch 11311 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

Refer to the QC report for details.

Sample 460-40258-11(5X) required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No other difficulties were encountered during the semivolatiles analyses.

All other quality control parameters were within the acceptance limits.

Lab Section	Qualifier	Description
GC/MS VOA		
	B	Compound was found in the blank and sample.
	U	Indicates the analyte was analyzed for but not detected.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
GC/MS Semi VOA		
	U	Indicates the analyte was analyzed for but not detected.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
Metals		
	U	Indicates the analyte was analyzed for but not detected.
	4	MS, MSD: The analyte present in the original sample is 4 times greater than the matrix spike concentration; therefore, control limits are not applicable.
	F	MS/MSD Recovery or RPD exceeds the control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
General Chemistry		
	U	Indicates the analyte was analyzed for but not detected.
